

Perform a review-only audit of the current Milestone 2 intelligence implementation.

Do NOT modify any files yet.

Review these areas against the project's Milestone 2.2.2 Provider Contract Specification:

- `src/intelligence/contracts/index.ts`
- `src/intelligence/client/index.ts`
- `src/intelligence/client/index.test.ts`
- the current `src/App.tsx` integration

Verify specifically:

1. `QueryIntent`
2. `ProviderResult`
3. `ProviderError`
4. `ProviderMetadata`
5. `SearchResult`
6. `Verification`
7. `RankingSignal`
8. `RankedSearchResult`
9. `AIProvider`
10. `SearchProvider`
11. `EventProvider`
12. `PlaceProvider`
13. `ResultNormalizer`
14. `Verifier`
15. `Filter`
16. `Ranker`
17. `CostTracker`
18. `IntelligenceResponse`

Pay particular attention to whether:

```
ProviderResult<T>.data: T[]
```

is intentionally compatible with:

```
AIProvider → QueryIntent
```

as well as the search/event/place providers.

Also verify that the current `understandQuery()` client and runtime validation are consistent with the contracts and that the `App.tsx` adapter does not violate the intended architecture.

Check for:

- discrepancies with the specification
- missing contract types
- unnecessary contract types
- incorrect field types
- inappropriate coupling to Supabase or a specific provider
- unnecessary Milestone 3 functionality
- test coverage gaps that should be addressed before locking the checkpoint

IMPORTANT:

- Do not add Tavily, Ticketmaster, Brave, OpenAI API calls, or other live provider integrations.
- Do not add credentials or environment variables.
- Do not change the UI.
- Do not change the database.
- Do not refactor unrelated Milestone 1 code.
- Do not modify files during this audit.

Return a concise report with:

A. Confirmed correct B. Issues requiring correction C. Questions/decisions requiring confirmation D.
Recommendation: ACCEPT AS-IS or NEEDS CHANGES

Do not make any changes until the review is complete.
